Professor Markus Stumptner

R Doe, K Kaur, M Selway, M Stumptner (2024)
Ecosystem Interoperability for the AECO Sector
The Journal of Information Technology in Construction
(ITcon) <https://doi.org/10.36680/j.itcon.2024.017>

‘There is no single source of truth, but many specialised, partial sources of truth that need to be coordinated.’

buildingSMART International

A ‘single source of truth’.
All data and information in one central location.

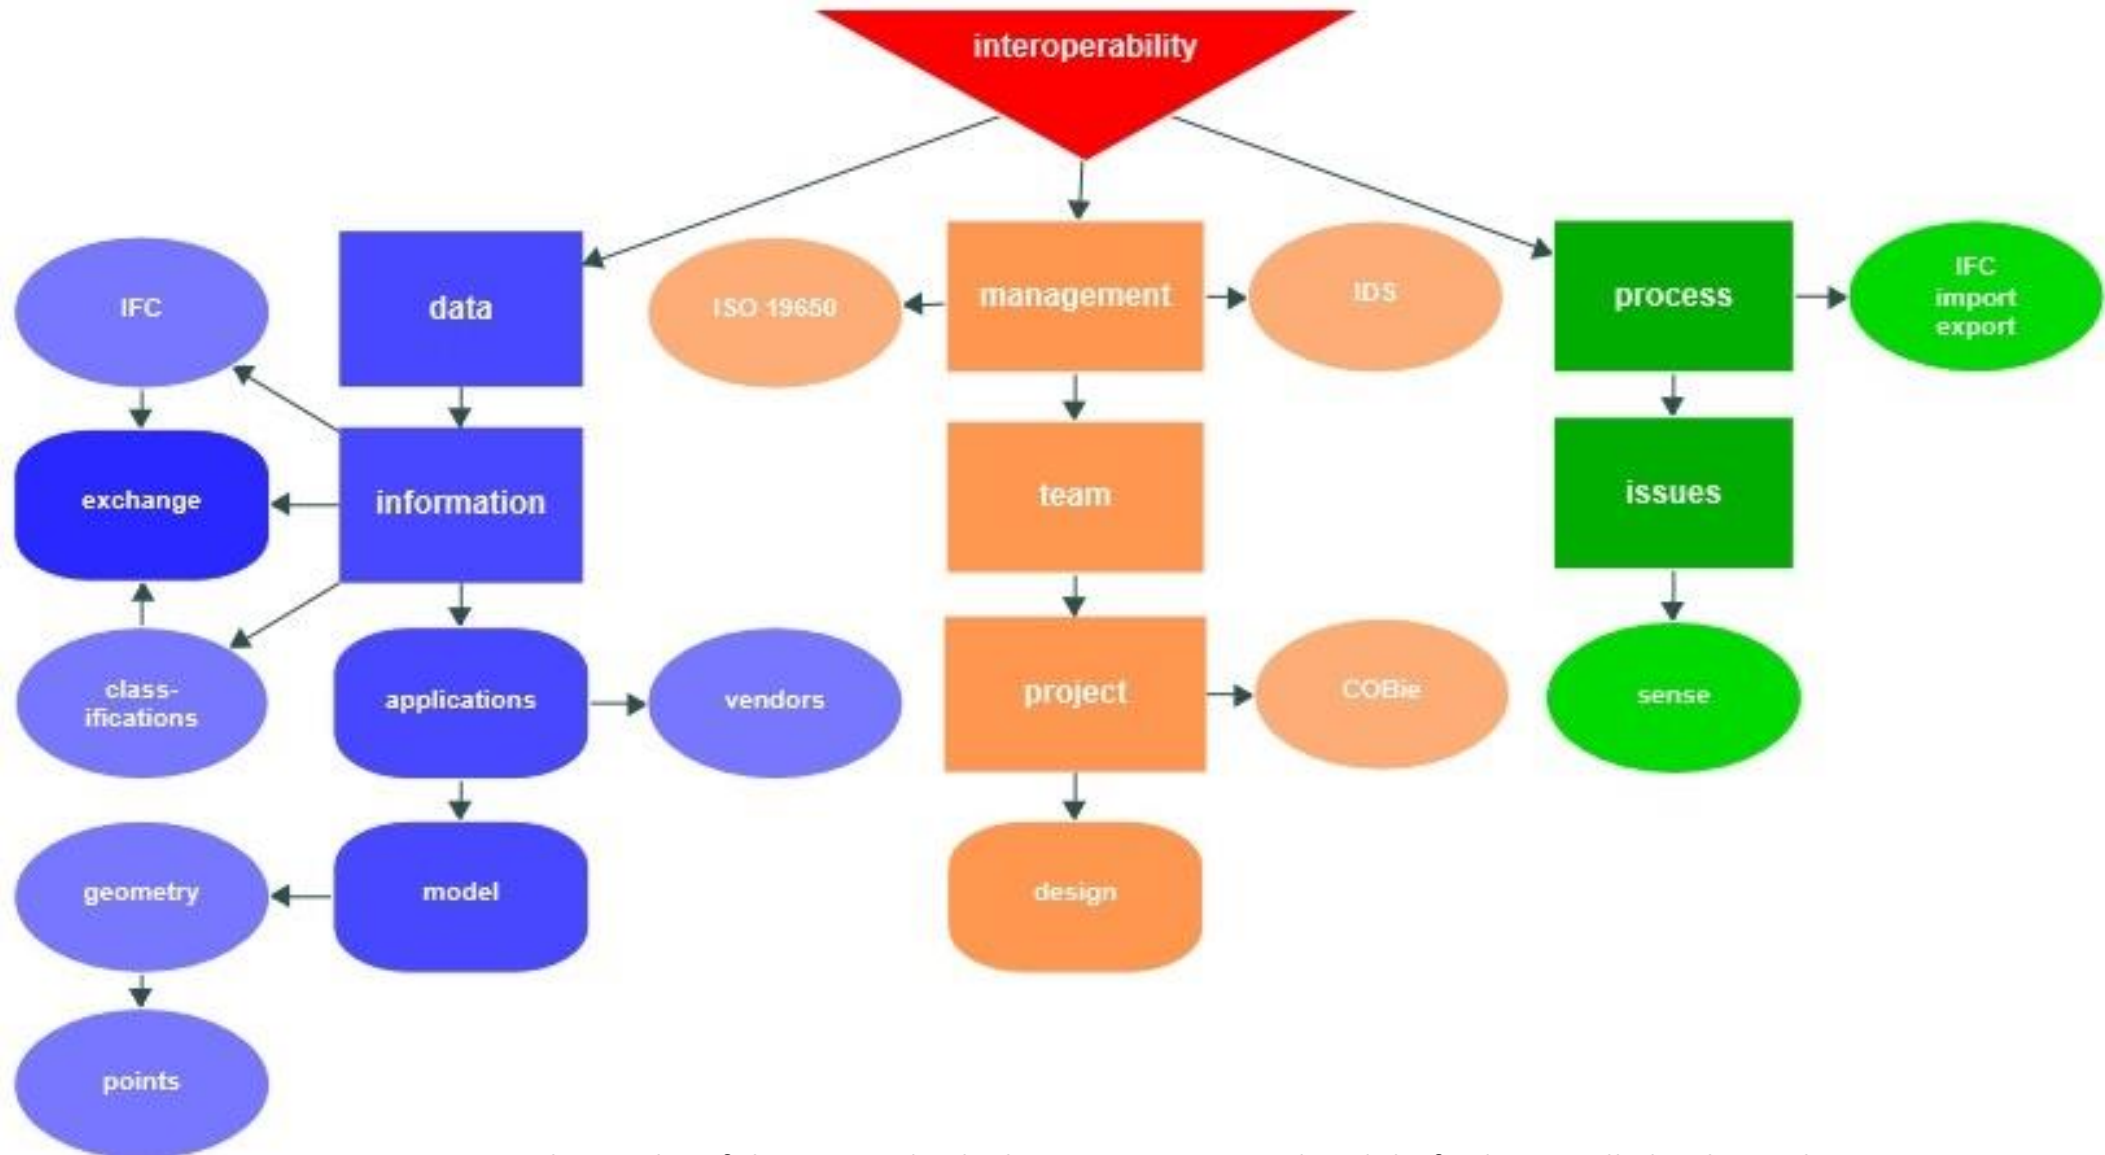

**'... my computer understands completely what
your computer program is saying.'**

Patrick MacLeamy, Episode 4, Build Smart

What does 'interoperability' mean anyway?

RQ1 (Primary): What issues continue to affect interoperability in an AECO organisation?

RQ2 (Secondary): Is sustainable development affected by interoperability issues?

Concept map: hierarchy of themes and sub-themes - interpreted and drafted manually by the authors.

information

‘...who’s interested in producing what information... people are much more interested in populating their own, or producing information for their own purposes.’ p.17

Reasserting the need for a common language - IFC

Rec 1. As there is no PCERT or similar certification available specifically for IFC, though online tutorials are available (e.g. Geometry Gym, Australia), our recommendation is that Professional Certification IFC (PCERT IFC) be developed by bSI as a framework for delivery by third parties to ensure that user input is correctly understood by those managing and implementing IFC for import and export, to and from proprietary models and CDEs.

data

'...data loss is more down to how the translator or mapping is built... But, with geometry issues, the default is to get back to the vendor and get them to find a solution, and some vendors are less willing to go the extra mile in resolving interoperability issues.' p.15

Vendor lock-in – how do we resolve issues around this?

Rec. 2. National and regional jurisdictions should be widely encouraged to improve interoperability best practice by mandating implementation of openBIM, vendor neutrality, and the common language IFC. For example, in 2017 the Australasian BIM Advisory Body (ABAB) which includes buildingSMART Australasia promoted a consistent approach to the use of BIM across national jurisdictions.

issues | multiple CDEs

‘...we have multiple CDEs on a project, and connecting information from one CDE to another is somewhat problematic.’ p.19

Common Data Environment (CDE), ISO 19650 (orgn. and digitisation of info. about BIM)

Rec. 3. We recommend that Germany's Publicly Available Specification (PAS), DIN SPEC 91391 series (Section 2.2.1) is promptly developed into a global ISO standard or incorporated into ISO 19650 series to provide clarity for the sector and software vendors. DIN SPEC 91391-1 covers CDE solutions applicable for BIM Levels 1-2 and looks towards new technologies to achieve BIM Level 3.

management

'...there's a lot of push back, a lot of behavioural change management to go through, to actually make it happen. It's a bit of a dead end in terms of its format, like the way you export it out into a COBie export doesn't go anywhere.' p.17

Handover – a test of coordination and the consolidation of information.

Rec. 4. COBie should be amended so that format outputs are consistently defined and clearly understood by users, clients and operators. Data and information consolidation tools used by clients and operators at handover should be examined and, where appropriate, referenced in COBie e.g. IBM Maximo, Ellipse, IBM TRIRIGA and SAP.

team

'...bringing data from a design team to construction to operations team normally involves quite strong interoperability challenges.' p.18

Handover – a test of coordination and consolidation of information.

Rec. 5. A 'golden thread of data and information' should be embedded in the ISO 19650 series to ensure accountability for the accuracy and reliability of data and information across the entire building lifecycle, including at handover stage. Similar to the Building Act (2022), UK, accountability should include the nomination of 'duty holders' and 'appointed persons' to embed responsibility into the process.

RQ1

key issue | a 'connected CDE'

'...So, the question is how they get connected... Are there third party add-ins that need to be on everyone's machine for all of this to work. Or is it some cloud-based, web-based method that needs very little input or version control of an application?' p.19

Ecosystem interoperability for AECO – Linked building data (LBD) or middleware?

Rec. 6. We propose implementing a proof-of-concept Network-Centric - Middleware, Shared Messaging Service. The Middleware Shared Messaging Service proof-of-concept aims to demonstrate reliable, automated cloud-based ecosystem interoperability with appropriate accessibility across lifecycle stages.

interoperability & sustainability

'...efficient sustainable design processes requires inputs and outputs that can move between technical applications.' p.13

'Why do our buildings cost the earth?'

Rec. 7. The impact of poor interoperability on sustainable development in the AECO sector needs to be better understood through more extensive and thorough research. Provided with accurate information, social and environmental stakeholders would be better informed and able to promote meaningful actions to mitigate the impacts on society and the environment of poor interoperability in the AECO sector.

rec. 2 | **national and regional jurisdictions**

Ongoing engagement: QLD Department of Housing, Local Government, Planning and Public Works;
SA Department for Infrastructure and Transport, BIM Industry Working Group.

rec. 6 | a **'CDE of CDEs'**

Proof of Concept completed Jan-Mar 2024.

Paper to follow.

AECO Ecosystem Interoperability

Proof of Concept | a CDE of CDEs

Completed: Jan-Mar 2024

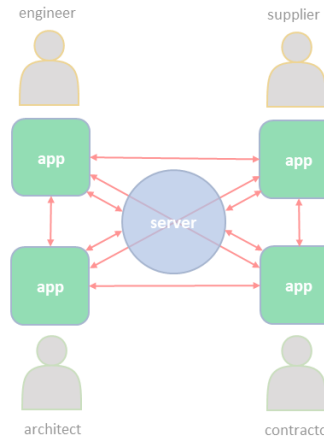

Researchers:

- Dr Matt Selway, UniSA STEM
- Andrew McRae, UniSA STEM
- Dr Robert Doe, UniSA Creative
- Professor Markus Stumptner

Seed funded by:

management, file export / import

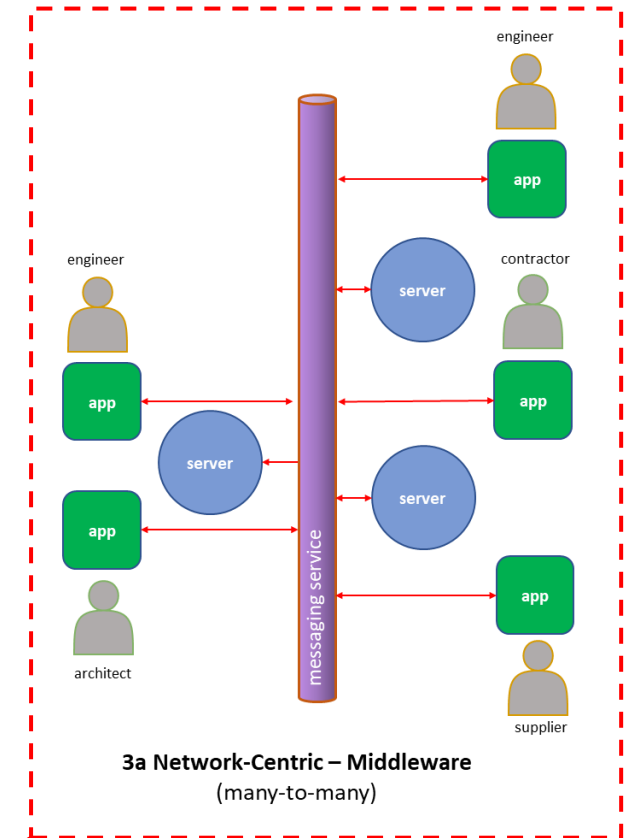

1 Point-to-Point
(one-to-one)

app Revit, Tekla, Navisworks, Excel, Archicad, Civil 3D etc.

2a Hub-and-Spoke
(many-to-one)

3a Network-Centric – Middleware
(many-to-many)

Standards-based | Network-centric | for AECO

Components

Authoring tool: BlenderBIM x 3

CDE: BIMServer

Geometry engine: IfcOpenShell

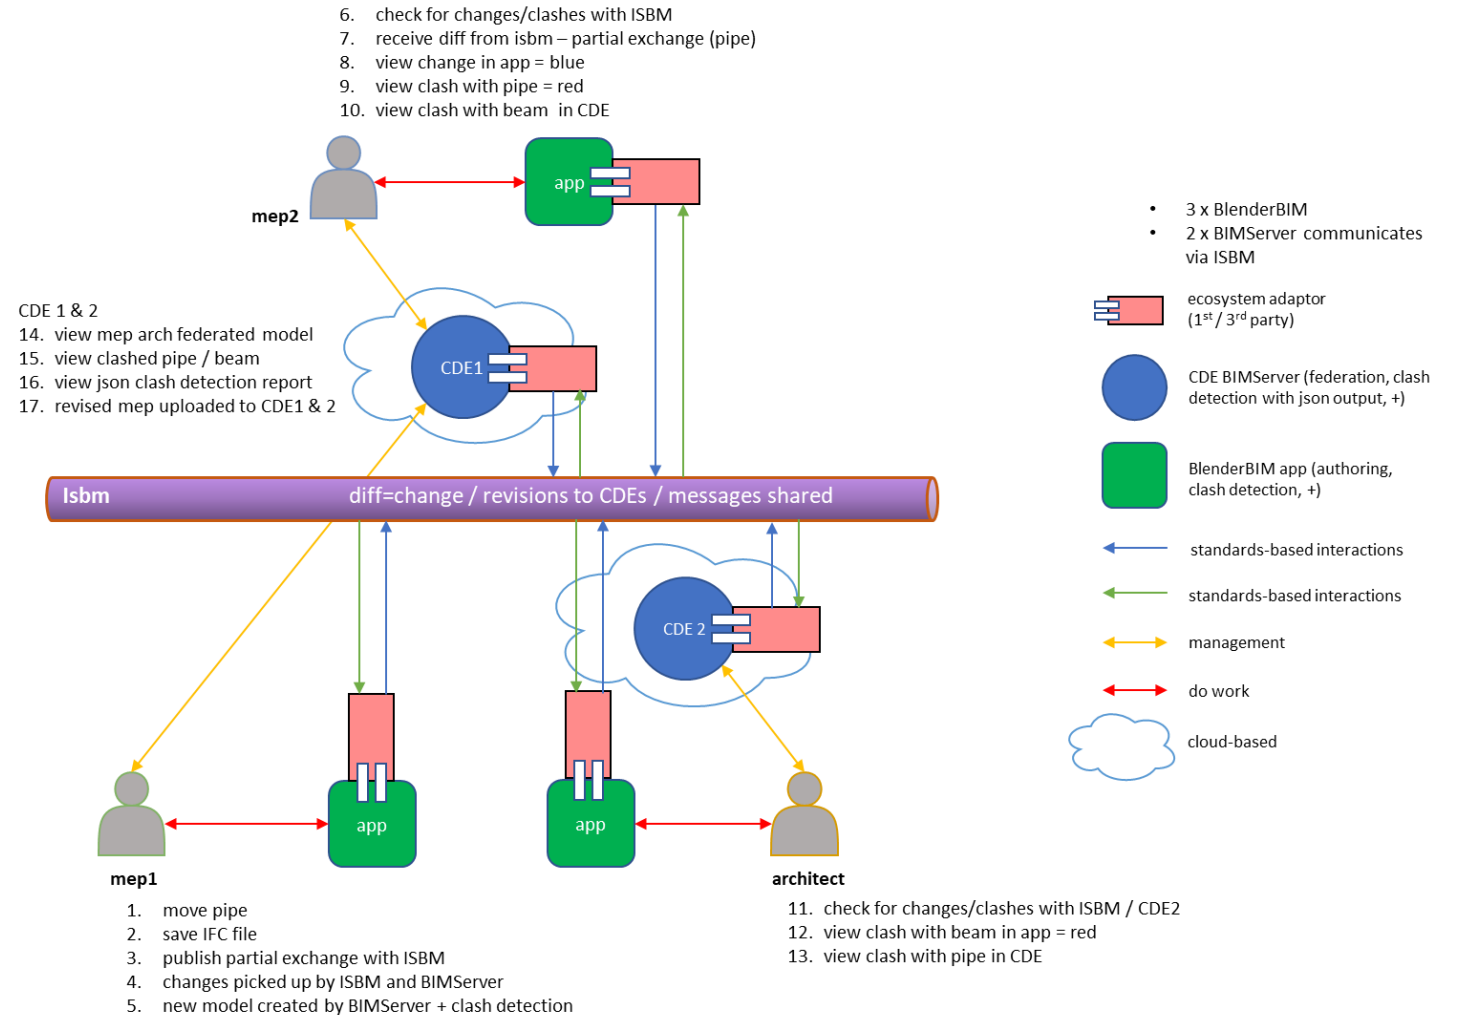

- Includes clash detection services

Infrastructure: SimpleISBM

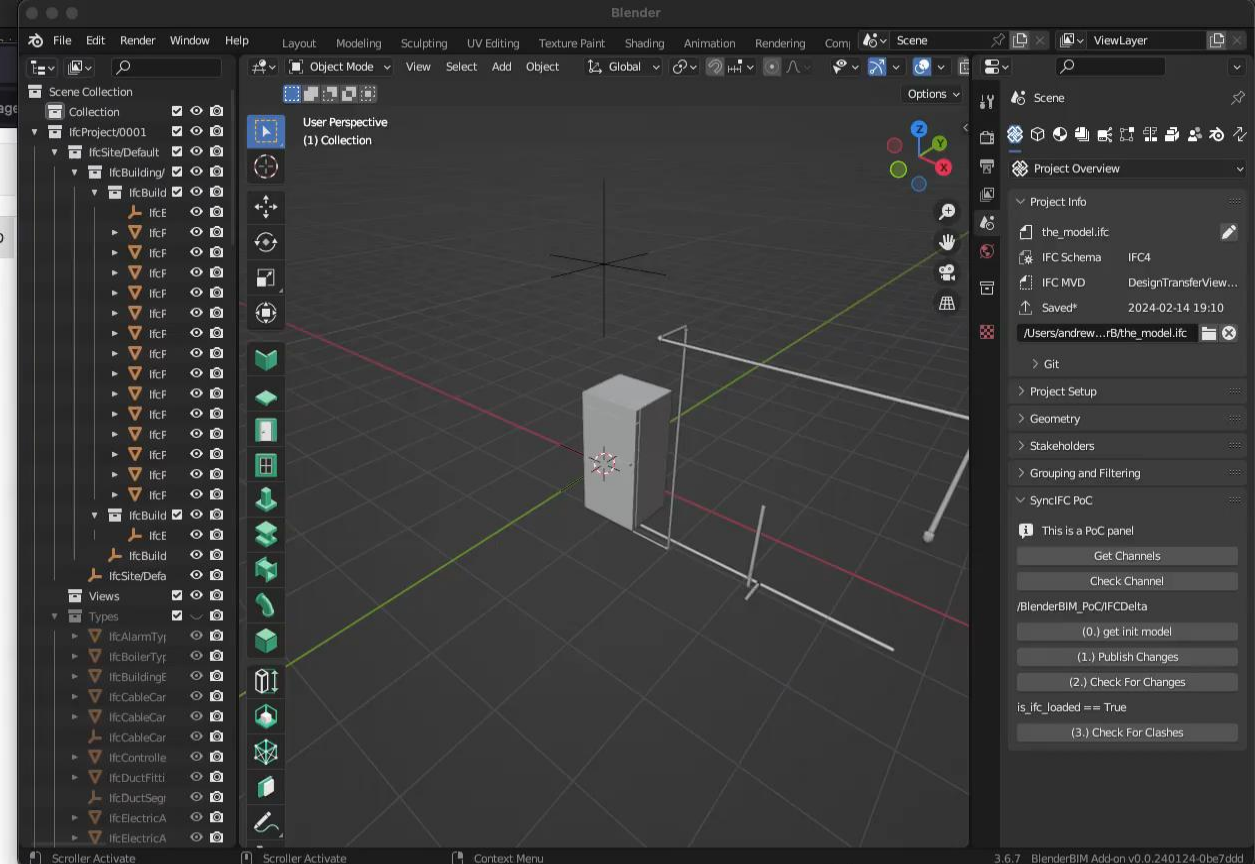

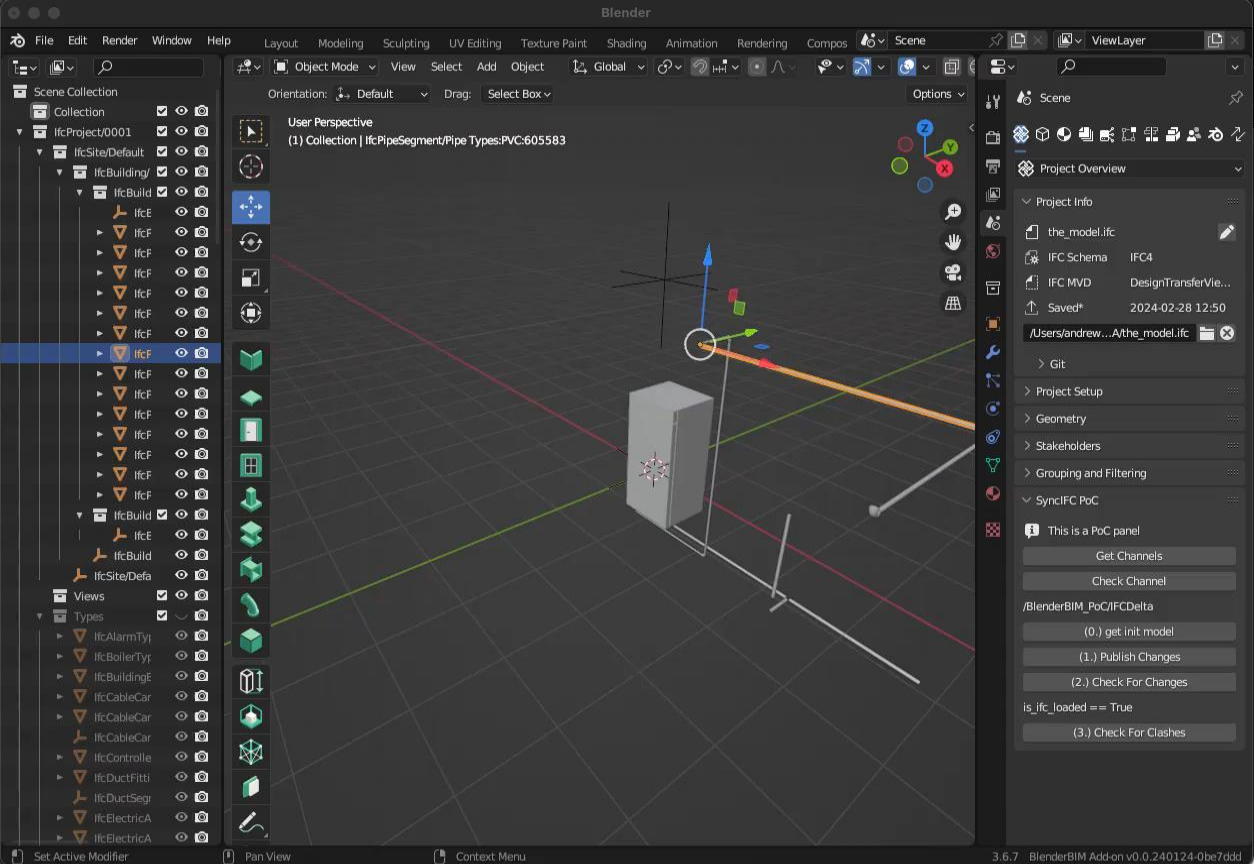

- Message bus developed by UniSA STEM and partners
- Leveraged open source, free applications to simplify implementation of **adapters**

Standards referenced:

- ISO 16739-1:2024 (IFC)
- ISO 19650 series (BIM organisation)
 - Metadata, e.g., Work States: WIP – Shared
- ISO 18101 (Automation & integration)
 - Oil & gas interoperability
- ISA-95 Part 6 (ISBM parent standard)
 - Messaging Service Model (MSM)

Use case | design discipline changes published and checked

```
0 item(s) were deleted
20 item(s) are common to both models
0 item(s) had simple changes
16 item(s) are queued for a detailed geometry check
... processing old shapes ...
... processing new shapes ...
... comparing shapes ...
1 item(s) were changed

Significance

Proof of Concept | a CDE of CDEs

- 1. Open standards-based**
 - any proprietary system can exchange data and information
 - tests integration of existing standards and identifies gaps for new/updated standards
- 2. Data management facilitated**
 - determines when, and at what level of detail, information is to be shared
- 3. Supports fine-grained, event-driven, interactions**
 - improves timeliness of information
- 4. Supports variety of workflows**
 - distributed, centralised, or mediated
- 5. An ecosystem from design through operations**
- 6. Improved collaboration**
 - participants and workflow stages integrated
 - asynchronous messaging services

AECO Ecosystem Interoperability
